cognassist

Your personalised learning journey starts here.

Cognassist helps to identify hidden learning needs, personalise support and transform learner attainment.

We're on a mission to help every learner reach their full potential through cognitive assessment.
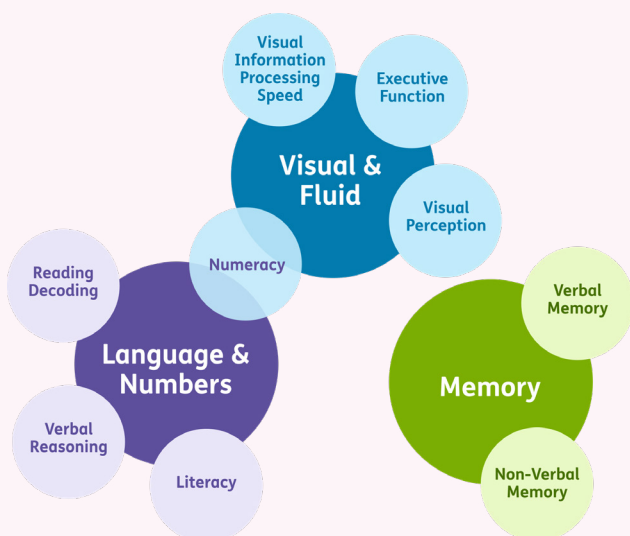

We all think and learn differently, which is why we believe education should not have a "one size fits all" approach.

Research shows that cognition and intelligence are separate.

Understanding your cognition can be difficult, but we're working to simplify it.

With this knowledge, you can work with your learning provider to get the most out of your personalised learning experience, gain powerful decision-making skills and get the outcomes you want.

Our cognitive assessment uses specifically designed tasks to measure the below nine key domains of the brain. This gives us insight into areas where you could benefit from support.

- Visual Information Processing Speed
- Executive Function
- Visual Perception
- **Visual & Fluid**
- Numeracy
- Reading Decoding
- **Language & Numbers**
- Verbal Reasoning
- Literacy
- Verbal Memory
- **Memory**
- Non-Verbal Memory

The Cognassist digital assessment uses tasks that require different cognitive abilities to find out which types of processing are naturally easier or harder for people.

While each task may seem straightforward for something that's trying to measure how our mind works, they have been refined over years of research.

We then use standard scoring and internationally recognised thresholds for learners who identify with specific needs. Why is this relevant to you?

We've currently profiled over 220,000 brains, including a significant amount of level 7 learners. From this data we've found that **20% of degree apprentices have an unidentified learning need.**

It's important to clarify that cognition and intelligence are separate. Individuals can be highly intelligent and still have a cognitive need.
